## ADVANCED HYGIENE FEATURES

### DEEP-CLEAN MODE™

This feature automatically cleans the cold water reservoir, water lines and drip tray. **Deep-Clean Mode** is pre-programmed to activate when the system is not in use. It works by injecting a concentrated amount of activated oxygen into the cold water reservoir. That water is then automatically dispensed into the drain-connected drip tray, cleaning the system.

The **Deep-Clean Mode** is fully customizable, allowing control over the timing and frequency of cleaning, as well as the desired concentration of activated oxygen.

## ADVANCED HYGIENE FEATURES

### AUTO-CIRCULATION FRESHNESS CYCLE™

This feature automatically dispenses a programmed volume of water into the drain-connected drip tray after a predefined period of non-use. This cycle helps prevent stagnant water in the filters or lines. This feature is great for businesses with holiday breaks, schools with summer breaks, or any prolonged period of non-use.

The **Auto-Circulation Freshness Cycle** can be programmed to customize the desired duration of non-use prior to initiation of the cycle, as well as the volume of water dispensed.
